OPERATION AND MAINTENANCE OF THE WATER DISPENSER.

When first used, or after prolonged periods of inactivity, wash the tank with water. The water dispenser supplies cold water without having to open the refrigerator door each time. This also allows for reducing the product’s energy consumption.

To fill the tank, lift the flap or remove the cover (see picture) then pour in the water with a carafe or other suitable container. Avoid filling the tank completely.

Always exclusively use drinkable natural mineral water: any other liquid may hamper the device’s correct operation.

To withdraw water with the refrigerator door closed, press the dispenser actuator with a suitable container (glass, carafe, etc.). Release the actuator once the desired quantity has been dispensed.

The water tank should be cleaned regularly under running water; do not use detergents. To clean the tank, remove the tank cover and upper ledges; subsequently, remove the tank by pulling it outwards while pressing the appropriate button (see picture).

The tank must be replaced back into its housing as soon as possible so as to avoid excessive heating of the refrigerator.

For more thorough cleaning, it is advisable to unscrew the valve from the tank (see picture) and clean it under running water.

! Be careful not to pull the transparent mobile element of the valve.

Once cleaning operations have been completed, screw the valve back on while ensuring that the internal seal adheres to the end part of the tank bushing; subsequently, put the tank-valve assembly back into the appropriate cylindrical housing of the door, while making sure that the upper hook on the rear wall of the tank is properly inserted in the appropriate compartment on the inner wall of the door. Put the previously removed ledges and tank cover back in place.

! Make sure that the tank has been properly inserted in the door (see picture).

! The presence of water drops on the tank walls is a normal occurrence during the product’s operation.

! Dry any drops present on the outer walls of the product.

! To empty completely the Water Tank, please disassemble it as shown on the picture, spill the water, clean with a soft textile and assembly in the product.

! If the water drops remain on the external door surface after use, clean it with a soft cleaning textile.
